CALL CENTER OPERATIONS

Location: Bantama, Kumasi

Date: Friday, 6th February, 2026

A. Current Core Duties of the Call Center

1. At the end of each working day, managers of the various stations send a snapshot of the day's delivery records to a WhatsApp platform.
2. The call center collates data from all stations and rewrites delivery details, including:
    - Name of recipient
    - Telephone number
    - Destination
    - Remarks after contacting the customer
3. When a customer calls the main office line requesting home delivery from any branch nationwide, the call center forwards the request to the appropriate station.
4. A customer may make an enquiry about their package or send a copy of their receipt to the Call Center. If the customer requests home delivery, the Call Center will forward the receipt and delivery request to the appropriate station's WhatsApp platform for action.

B. What the Current System Does

1. Call center functions are embedded within individual stations.
2. The responsibility of calling parcel owners to ask whether they require home delivery lies with either:
    - The station manager, or
    - The front desk officer.
3. When recipients request home delivery, their details appear under the "Call Center" section in the system.
4. Once a recipient has been contacted, their record disappears from the Call Center section.

5. In summary, the current Call Center module only handles parcels **pending dispatch**.
    - It does **not** support post-delivery follow-up.
    - There is no centralized ("universal") call center visibility after deliveries are completed.

C. Desired Improvement (Proposed System Enhancement)

The goal is to introduce a **centralized, universal call center** capable of conducting **post-delivery follow-ups** nationwide.

Proposed Features:

1. Users assigned the role **"Call Center"** should **not** be tied to any specific station.
2. Call Center users should have access to **all delivery records across all stations nationwide**.
    - This eliminates the need for managers to send handwritten snapshots via WhatsApp.
3. For each delivered parcel, Call Center staff should be able to:
    - Click a **call button** directly from the system.
    - Contact the recipient for delivery feedback.
4. After each follow-up call, Call Center staff should be able to record remarks using:
    - Predefined options, such as:
        - No comment
        - Not reachable
        - Unanswered
        - High cost
        - Rider was rude
        - Did not receive any package
        - Wrong contact

    - An **“Other”** option, allowing free-text input.
5. On the **Admin Dashboard**, administrators should be able to:
    - See which parcels have been followed up.
    - Track follow-up status for accountability and quality control.

---

4. Summary of Benefits

- Eliminates manual data sharing via WhatsApp.
- Centralizes call center operations nationwide.
- Enables structured post-delivery customer feedback.
- Improves service quality monitoring and accountability.
- Provides management with clear visibility through the admin dashboard.
